4) isalpha ( ) :-

It returns true if all the characters of given string are alphabate

e.g.

```
a = "abcd"
print (a.isalpha())
```

5) isdecimal ( ) :-

It returns true if all the characters of given string are decimal.

e.g.

```
a = "4545"
print (a. decimal ())
```

* fibonacci series ⇒

```
n= int(input ("enter value for n = "))
a= 0
b = 1
print ("fibonacci series are:")
print (a)
print (b)
for i in range (2, n+1, 1):
                c= a+b
                print (c)
                 a= b
                 b= c
```

String

1) isdigit ( ) :-
It returns true if all the characters of given string are in digits.
syntax:-
string_name. is digit
e.g.
print(a. isdigit ())
a= "123"
o/p: True

2) isnumeric ( ) :-
It returns true if all the characters of given string are in numeric value like digits, fractions ($1/2$), superscripts (x^2) subscripts (H_2), roman numerals, numerical representations, currency symbols etc
e.g.
print(a. isnumeric ()) 2)print (a. isnumeric)
a = "123" a= "\u00BC"

3) isalnum ( ) :-
It return true if all characters of given string are either alphabates or digits
e.g
a= "123 abcd"
print (a. isalnum ())
