

Type casting →

converting one datatype into another data type is known as typecasting

* There are two types.

① implicit

② Explicit

① implicit ⇒

converting one data type into another datatype without the help of user or by the compiler are known as implicit typecasting

② Data cant be lost.

```
#include <iostream.h>
```

```
#include <conio.h>
```

```
void main()
```

```
{
```

```
    int a = 10
```

```
    float b;
```

```
    b = a;
```

```
    cout << "b";
```

```
    getch();
```

```
}
```

data cant be lost.

③ smaller datatype conversion into high datatype.

* Explicit →

① converting one datatype into another data type by using user.

new-variable = (datatype) old variable

```
void main()
```

```
{
```

float a = 10.5;

int b;

clrscr();

b = int(a)

cout << "value of b";
