

Unit-1: Introduction to Computer and MS-Word

Introduction to Computer: Computer is an electronic data processing device which accepts and stores data input, processes the data input, and generates the desired output in a required format. It also stores the data or information in memory called as Computer. We can say computer a versatile machine because it is very flexible in performing their jobs.

□ Applications of Computer:-

1) Business: - A computer has high speed of calculation, accuracy, reliability or versatility which has made it an integrated part in all business organizations. Computer is used in business organizations for –1) Payroll calculations 2) Budgeting 3) Sales analysis 4) financial forecasting 5) Managing employee database 6) Maintenance of stocks, etc.

2) Industry: - In industry Computer are used for controlling manufacturing equipment, monitor processes, acquiring and analyzing data.

3) Banking: - Banking is almost totally dependent on computers. Banks provide the Making deposits and overdrafts, checking interest charges. There are following facilities online accounting facilities, ATM Machine which includes checking balances, withdraw the money.

4) Education:-

The computer provides a tool in the education system known as CBE (Computer Based Education). Computer education rapidly increase the graph of number of computer students. The computer providing lot of facilities in Education like to maintain student data, to perform practical's related to programming, to maintain books in library.

5) Engineering: - Computers are widely used for engineering purpose. One of the major areas is CAD (Computer Aided Design) that provides creation and modification of images.

Structural Engineering – Computers deal with Design of ships, buildings, airplanes, etc.

Industrial Engineering – Computers deal with design, implementation, and improvement of integrated systems of people, materials, and equipment.

Architectural Engineering – Computers help in planning and designing of buildings, 2D and 3D drawings.

Characteristics of Computer and Advantages of Computers:-

1. Speed – Computers can execute programmes quickly. Thousands of instructions can execute in milliseconds or seconds.

2. Accuracy – Computers can perform very complex computations accurately in a very short period of time. If a user inputs the correct input to the computer, it gives accurate results that can be used in decision-making.

3. Storage – Computers can store large amounts of data permanently. The data is saved in files, which can be accessed at any time; these files are saved for a long time period until a user deletes them.

4. Power of Remembering – A computer stores data permanently. It forgets or loses certain information only when asked to do so.

5. Versatility – A computer is a versatile device. It can run different programmes simultaneously.

6. Diligently – A computer can do the assigned task diligently. A computer can work for hours without getting tired. Hence, it can do thousands of complex computations with the same accuracy.

7. Automation – A computer is an automated device. It works without human intervention.

Disadvantages of Computers:-

1. Dependency

- It functions as per a user's instruction, so it is fully dependent on human being

2 Environment

- The operating environment of computer should be dust free but it increases E wastage.

3. No I.Q. – A computer does not have its own I.Q.; it carries out the predetermined tasks and does not take its own decisions.

4. No Feelings – A computer does not have emotions. It works as per the given instructions by users.

Concept of Hardware and Software:-

Any unit or device of computer system is divided into two types such as hardware and software.

Hardware:-

The physical components of the computer such as electronic device is called as hardware. So hardware is actually machine you can see and touch.

E.g. Monitor, Mouse, Keyboards and CPU etc.

Software:-

Software is a set of program .Program are the instruction that us to the computer to processes on data to usable form.

There are two types of software: - I) **System software.** II) **Application software.**

I) **system software:** - It is set of program i.e. used to operate and maintain the computer system.

Operating System: - It is set of program it acts as an interface between user and hardware.

Ex. DOS, UNIX, LINUX, WINDOWS

Utility System: - It is a program which assist to maintaining and improving efficiency of computer system.

Ex. Fire wall, Quick Heal, Net protector etc.

Language Translator (compiler or interpreter):- High level lang. translate into machine level language and it also check the language syntax.

II) Application Software:-

It is set of program which perform a specific task required for the user .Programs are developed for satisfying the requirements of the user Ex. MS-Word ,MS-Excel, Power Point, Calculator Some commonly known application software are as follows.

Word Processing Software: - word processing software enables us to make use of computer for creating, editing, formatting, storing, retrieving and printing the document.

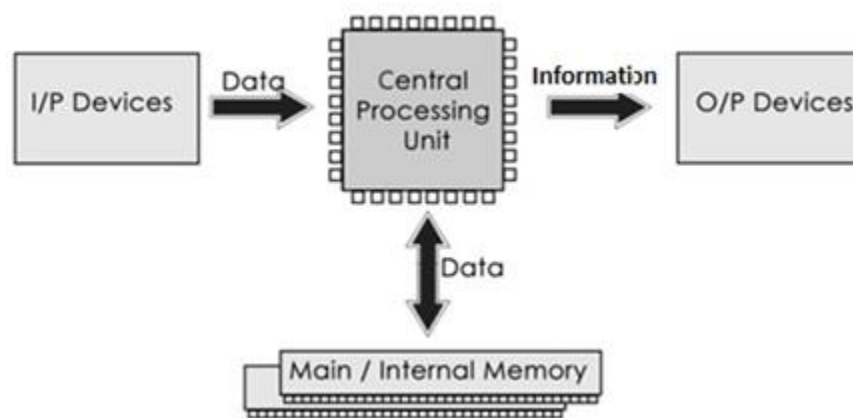

Data Base Software: - The data base software is a collection of related data stored and treated as unit for information retrieval purpose. A data base software is a set of programs that enable us to create the database for to add, to delete, update and insert the record.

Educational software: - education software allows a computer to be used as teaching and learning tool.

Entertainment software: - The entertainment software allows a computer to used as entertainment tools.

Block Diagram of Computer: Computer systems consist of three components as shown in below image: Central Processing Unit, Input devices and Output devices.

Input devices provide data input to processor, which processes data and generates useful information that's displayed to the user through output devices. This is stored in computer's memory.

Central Processing Unit

The Central Processing Unit (CPU) is also known as "the brain of computer". It controls operation of all components of a computer.

Control unit acts as the "brain" of the CPU. It executes instructions and manages the flow of data inside the CPU to perform the tasks specified by a computer program

Arithmetic Logic Unit (ALU)

Arithmetic Operations – The ALU can perform basic arithmetic operations such as addition, subtraction, multiplication, and division.

Logic Operations – The ALU can also perform logical operations like AND, OR, NOT, XOR, and bit-shifting operations.

Comparison – The ALU can compare two binary values and determine whether they are equal, greater than, or less than each other. This function is most widely used in programming and sorting algorithms.

Memory Unit

A memory or storage unit is a hardware component which is used to store the data and instructions. Majorly computer memory has categorized as temporary (RAM) and permanent memory (secondary memory).

RAM is used for short-term, fast data access and essential for active program execution. On the other hand, secondary memory provides permanent data storage.

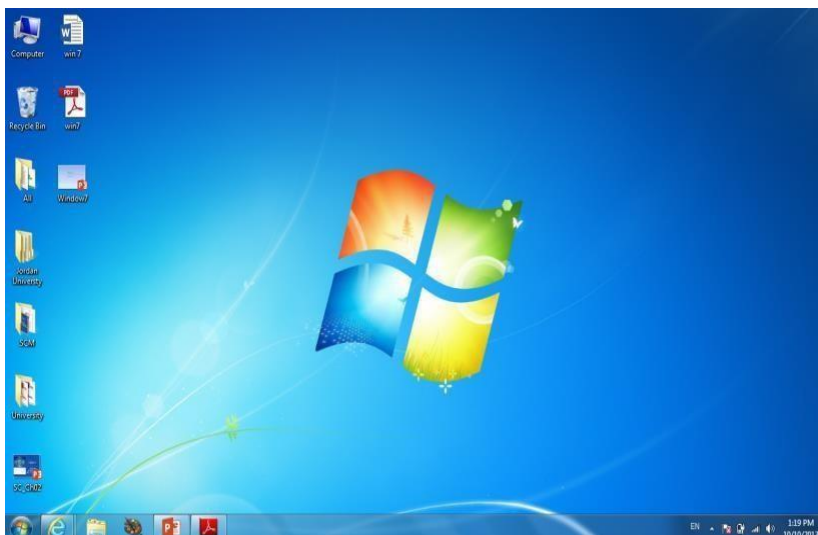

Storage devices are used to store the data permanently, even when the computer is powered off.

They are non-volatile in nature it is ROM memory of computer system; the data remains save when the power is shut down or system restarts.

The most popular and commonly used storage devices are Hard Disk (HDs), Solid-State Drives (SSDs), USB flash drives, and optical disks (e.g., DVDs), pen drives.

- The Desktop

The Desktop is the main Windows 7 screen (see image below). It is the work area where dialog boxes, windows, icons, and menus appear. Like an office desk, the Windows 7 desktop contains items you can use to do your job. For instance, from your desktop, you can perform file-management tasks and run software applications.

1- Icons: An icon is a graphic image, a small picture or object that represents

a file, program, web page, or command. Icons help you execute commands, open programs or documents quickly. To execute a command by using an icon, click or double-click on the icon. It is also useful to recognize quickly an object in a browser list. For example, all documents using the same extension have the same icon. We can classify icons as the following

• **Folder Icons** • **File Icons** • **Shortcut Icons**

Folder Icons

File Icons

Shortcut Icons

Microsoft Word:-

- **Useful features in Microsoft Word**

1. Check document for spelling and grammar errors

After typing contents in the Word document, you can use the spell checker to find out those words that have typing errors so that you can correct them, and makes it easier to replace words or phrases throughout the Word document by the Word recommendation.

You can access this command using this way: go to the Review tab, click Spelling & Grammar in the Proofing group.

2. Add Header, Footer and Page Number

To make it easier to organize Word contents well, Microsoft Word does not only allows you to separate contents into different paragraphs based on topics, it also lets you add Page Number, Header and Footer to each Word page so that the readers can easily indicate the main subject and the position, where he or she is, in the Word document.

You can add Page Number, Header and Footer by these steps: go to Insert tab, find Header & Footer group on the top, click Header, Footer or Page Number to type information and settings.

3. Protect Word document with password

After typing contents in the Word document, you may want to set password to protect it. It is easy: click the Office button, go to Prepare, click Encrypt Document, type a password in the dialog box and then click OK.

4) **Changing the size** of the margins can reformat complete document or part of text.

5) **Font size** and type of fonts can also be changed.

6) **Spelling** can be checked and correction can be made automatically in the entire document.

7) Text can be formatted in column style as we see in the newspaper. Text boxes can be made.

8) **Tables** can be made and included in the text.

9) Word also allows the user to mix the graphical pictures with the text. Graphical pictures can either be created in word itself or can be imported from outside like from Clip Art Gallery.

10) Word also provides the **mail-merge** facility.

11) **Page numbers** and **Header and Footer** can be included.

12) **Word count** and other statistics can be generated.

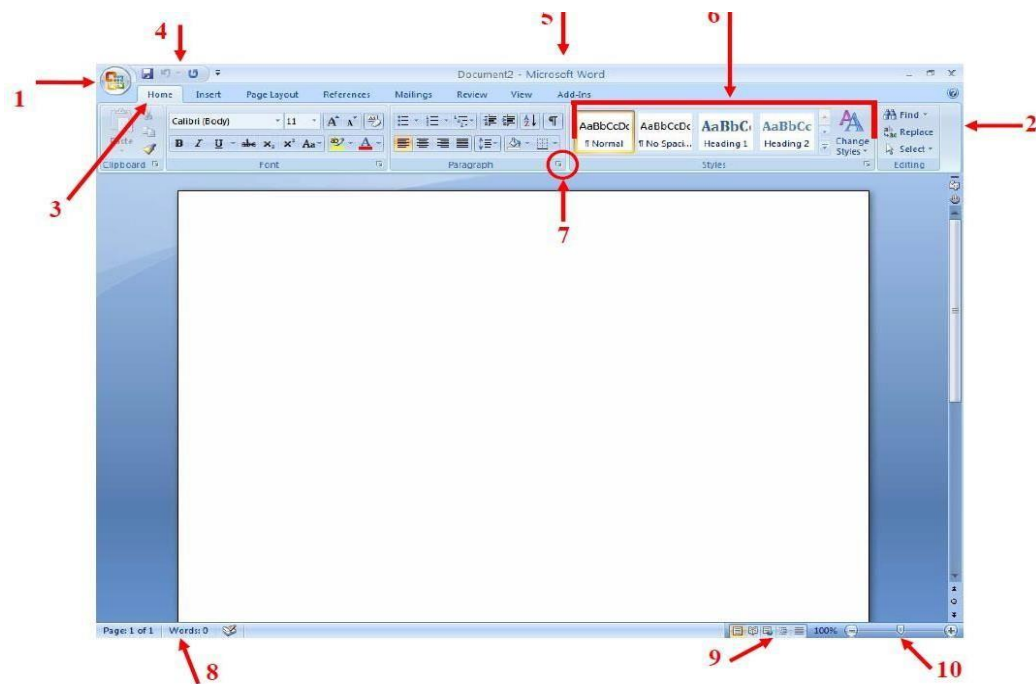

13) Different **shapes, Smart Art and chart** can be included.

14) **Hyperlink**. We can link one file to another file or page.

How to open Microsoft word: -

Select Start -> All Programs -> Microsoft Office -> Microsoft Office Word 2007.

Application Window of MS-Word 2007(Components of MS-Word) :-

1. **File Menu:** This is the Office button which is similar to the **File menu** in previous versions. Here is where you will find commonly known features such as Restore, Minimize, Maximize, in Documents. The File Menu Is found at the upper-left corner of the Word 2007 window.

2. **Ribbon:** The Ribbon replaces the menus and **toolbars** in previous versions. The Ribbon makes it easier to see and find commands to format your document.

The *Ribbon tabs* provide you with a set of tools that are relevant to what you are currently doing. In the example above, the **Home** tab contains formatting and editing options. In this Ribbon there are many buttons that are grouped into categories such as Clipboard, Font, and Paragraph.

3. **Tab:** An area on the Ribbon that contains buttons that are organized in groups. The default tabs are **Home, Insert, Page Layout, Reference, Mailings, Review and View**. This is the Tabs Bar. When you select a tab it will display the Ribbon associated with that tab. Here everything has been changed into button form.

4. **Quick Access Toolbar:** By default the Quick Access Toolbar displays the Save, Undo, Redo buttons and is used for easy access to **frequently used commands**. To customize this toolbar click on the dropdown arrow and select the commands you want to add. The *Quick access toolbar* provides a set of frequently used commands.

5. **Title Bar:** A horizontal bar at the top of an active document. This bar displays the name of the document and application. At the right end of the Title Bar is the Minimize, Restore and Close buttons.

6. **Groups Categories:** A Group of buttons on a tab that are exposed and easily accessible. These buttons were formally embedded in menus on the Menu Bar.

7. **Dialog Box Launcher:** A button that launches a dialog box containing options for defining a command.
8. **Status Bar:** A horizontal bar at the bottom of an active window that gives details about the active document.
9. **View Toolbar:** A toolbar that enables, adjusts, and displays different views of a document's content.
10. **Zoom Button:** A button that magnifies or reduces the contents in the document window.

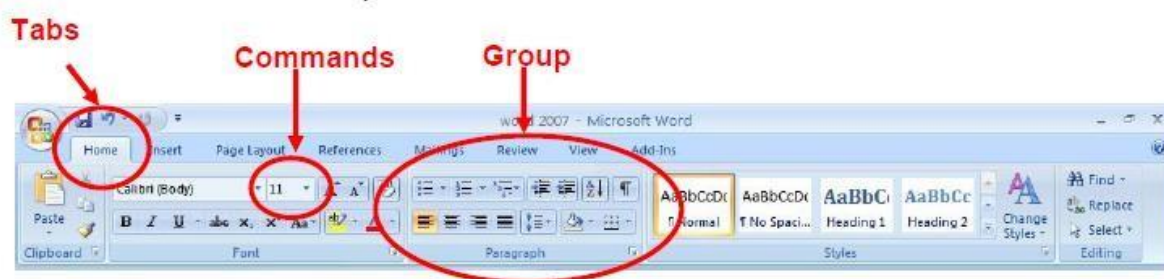

Understanding the Ribbon

There are three basic components to the Ribbon:

Tabs sit across the top of the Ribbon. Each one contains buttons that are organized in groups.

Groups are sets of related commands. They pull together all the commands you're likely to need for a type of task, and they remain on display and readily available, giving you rich visual aids.

Commands are represented as Buttons. The term Buttons replaces the term Icon in previous versions.

Navigating in a Document

The following table lists ways to navigate in a document using your keyboard to move the insertion point in an active document:

To move the insertion point	Press....
Left one character	Left Arrow
Right one character	Right Arrow
Down one line	Down Arrow
Up one line	Up Arrow
Left one word	CTRL + Left Arrow
Right one word	CTRL + Right Arrow
To the beginning of the current line	Home
To the end of the current line	End
To the beginning of the document	CTRL + Home
To the end of the document	CTRL + End
To the beginning of the previous page	CTRL + Page Up
To the beginning of the next page	CTRL + Page Down
Up one screen	Page Up
Down one screen	Page Down

•

- **To Create a New Word Document:-**

- 1) Click the **File Tab**
- 2) Click **New**
- 3) Select **Blank Document**
- 4) Click on **Create**

- **To delete a document:-**

1. Click the **File Tab**
2. Click **Open**.
3. Locate the file that you want to delete.
4. Right-click the file, and then click **Delete** on the shortcut menu.

- **To open a document:-**

1. Click the **File tab**.
2. Click **Open**.
3. Select the file that you want to open.

- **Save File and Close Word:-**

You can use the Save option on the File menu, to save a document. You can also save a document by typing Ctrl+s. The first time you save a document, the Save As dialog box appears.

Use the Save As

Dialog box to locate the folder in which you want to save your

document and to give your document a name. After you have saved your document at least once, you can save any changes you make to your document simply by clicking the Save after you click the File Menu.

1. Click the File Menu.
2. Click Save. The Save As dialog box appears, if you are saving your document for the first time.
3. Specify the correct folder in the Save In box.
4. Type your File Name in the File Name box.
5. Click Save.

Every time you save your document, you overwrite the previous version of your document. For example, you create a document and save it. Later you delete several passages from the document and then save your changes. To save the document using a different name, click the File Menu. A menu appears. Click Save As. The Save As dialog box appears. Use the File Name box to give your document a new name.

- **Password protecting Microsoft Word:-**

To protect the document from unauthorized user.

1. Open Microsoft Word or Excel and the document you want to put a password on.
2. Click the **File Tab**
3. Select **Info** and click Protect documents click on **Encrypt Document**.
4. Once you have selected a password, type it in the **Password** text field, and then click **OK**.
5. Type the password again in the **Re-enter Password** text field and click **OK**.
6. **Save** the file to save the new password.

- **Understanding Document Views Word**

To Display Different Views:

- 1) Click the **View** tab, in the Documents Views group
- 2) Click on the desired view ~OR~

- 3) Click a **View Button** on the View Toolbar in the lower right corner of the Status Bar

Print Layout View: Shows a document as it appears on a printed page.

Full Screen Reading View: Displays as much of the content of the document as will fit in the screen.

Web Layout View: Shows a document as it appears in a web browser.

Outline View: Shows the structure of a document, which consist of heading and body text.

Draft View: Displays the content of a document with a basic layout. It is the most frequently used view.

Zoom: Magnifies or reduces the contents in the document window.

Editing and Proofing Documents

Selecting Text

- **Select a word:** Click and drag or double-click on the word
- **Select a sentence:** Click and drag or click in the sentence while holding down the CTRL key
- **Select a paragraph:** Click and drag or triple-click in the paragraph or double-click in the selection area to the left of the paragraph
- **Select a block of text:** Click and drag or click to the left of the first word, hold down the SHIFT key, and then immediately click to the right of the last word
- **Select a line:** Click and drag or click in the selection to the left of the line
- **Select an entire document:** Triple-click in the selection area or hit the CTRL + A keys
- **Deleting text:** Select the text and hit the DELETE key
- **Undo an action:** On the Quick Access Toolbar click the Undo key

Cut, Copy and Paste

Often times you will need to move text from one location in a document to another, or to a different application. In this case you will perform a **Cut and Paste**. To reproduce a specific part of a document and place it elsewhere, you will perform a **Copy and Paste**.

To Cut Text:

- 1) Select the text you want to move.
- 1) Click on the **Cut** icon  located on the Home tab in the Clipboard group.

• **File Operations:-**

- 1) **NEW:** To open a new doc file
- 2) **Open:** To open an Existing File
- 3) **Close:** To close the active document but does not quit the application.
- 4) **Save:** To save the current File.
- 5) **Save As:** To save the Current file by specifying the location and file name.
- 6) **Print:** - Print the document.
- 7) **Print Preview:** shows how the file will appear when you print it.

Editing function such as:

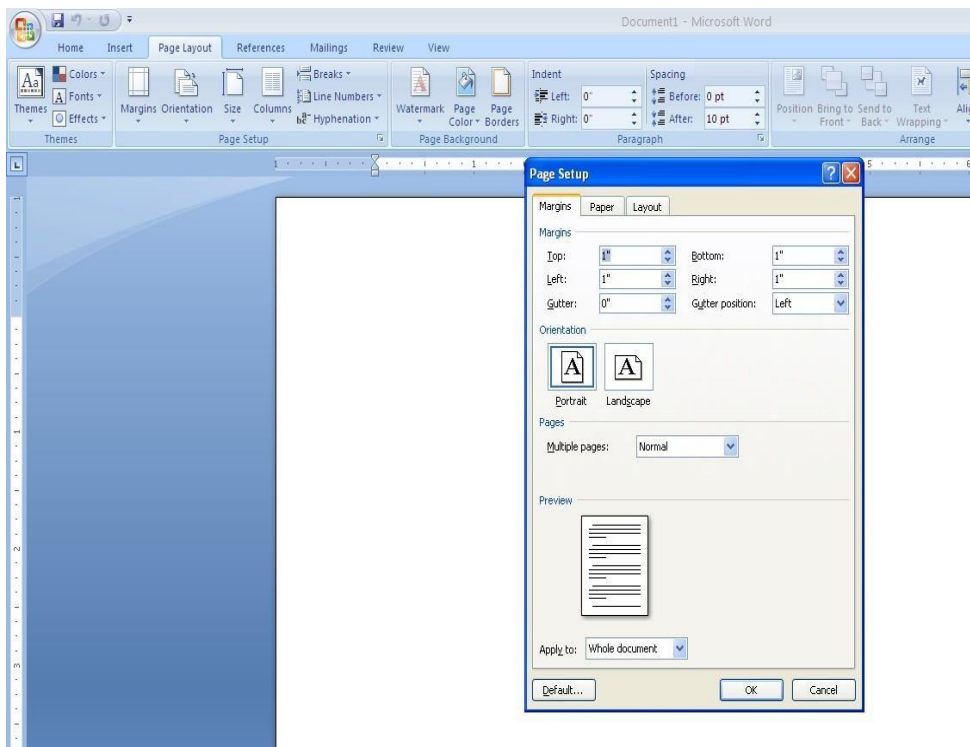

- 1) **Undo:** Undo the previous action.
- 2) **Redo :** After an action has been undone. It can be reinstated in the document
- 3) **Cut :** Cut the selected text and place it on the clipboard.

- 4) **Copy** : copy the selected text on the clipboard.
- 5) **Paste** : paste the contents of clipboard at the insertion point or whatever is selected .
- 6) **Clear** : delete the selected the object or text but does not place it on the clipboard.
- 7) **SelectAll** : Select the entire document.
- 8) **Find** : To search specific text in active document.
- 9) **Replace** : To find the replace specific characters or words.
- 10) **Goto** : It helps to reach the specific place in the document.

• **Page Setup /Page Setting :-**

Use the Page Setup Dialog box to change the margins in a document, to change the paper size, and to change the layout of the document. After calling up the Page Setup Dialog box, you see three tabs: **Margins, Paper, and Layout**. When working in these tabs, you can apply the changes to the Whole Document, This Point Forward, or This Section.

- Click **Page Layout** tab
- Move to **Page Setup** group
- Click on dialog box launcher on page setup group.
- The **Page Setup** window pops up

This tab allows you to set the margins in the document. You can set the following margins:

- **Top:** Sets the distance from the top of the page to the first line of text.
- **Bottom:** Sets the distance from the bottom of the page to the last line of text.
- **Left:** Sets the distance from the left edge of the page to the start of the text.
- **Right:** Sets the distance from the right edge of the page to the end of the text.
- **Gutter:** Sets an additional amount of

margin space for pages that are to be bound.

Paper tab

This tab includes the following options for setting your paper size:

- **Paper Size:** Allows you to pick from a variety of paper sizes, including Letter, Legal, A4 and various other envelope sizes.
- **Width:** Sets the width of the paper and is automatically set when you choose a Paper Size. If you change the value of this field, the Paper Size field changes to Custom Size.
- **Height:** Sets the height of the paper and is set automatically according

to the Paper Size. Changing the height automatically changes Paper Size to Custom Size.

Layout tab

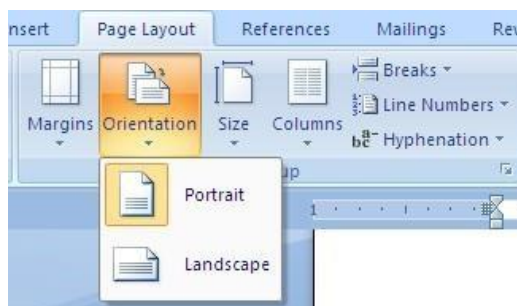

This tab has the leftovers that don't fit in the other tabs, such as the Line Numbers control and formatting sections, headers, footers, and page alignment.

The next button in the Page Setup section is **Orientation**. The Orientation button lets you choose which direction your document will print either Portrait or Landscape.

Next is the **Size** button click the down arrow on the size button to see the menu. This menu lets you select the size of paper you will be printing your document on. Scroll through the options using the Scroll bar on the right.

The **Columns** button is great for newspapers and newsletters. This feature will break your document up into as many columns as you would like. You can make your selection either before or after typing your articles. More Columns give you not only the option of how many columns but the spacing and width of your columns can be adjusted by clicking on the more columns option. This will open the window for you to make adjustments to your columns.

- **Formatting a Paragraph**

A paragraph is a select group of text that can have its own formatting characteristics, such as alignment, spacing and styles.

- 1) Select the desired paragraph(s) that you want to format
- 2) Make your paragraph formatting selections using one of the methods listed below

Commands for paragraph formatting can be found on the **Home** tab in the **Paragraph** group

By default, paragraphs are usually left-aligned: the left margin is straight, but the right margin is jagged (like in this manual). Word provides you with a number of other options though. Just position your cursor anywhere in the paragraph, and click one of the text alignment buttons on the Home ribbon.

- Align left: text is aligned at the left margin but jagged on the right.
- Center: text is centered within each line, with jagged margins on both left and right.
- Align right: Text is aligned at the right margin but jagged on the left.
- Justify: text is aligned at both the left and right margins (Word does this by adjusting the amount of space between words)

Change the line spacing for paragraphs

1. Select the paragraphs for which you want to change the line spacing.
2. On the **Home** tab, in **Paragraph**, click **Line Spacing**
3. Click on **Line Spacing Options**, and select options you want under **Spacing**.

- **Formatting Page**

After you type text into a document, edit it, and check it for spelling or grammatical errors, you are ready to make it look pretty, a process known as formatting text. A properly formatted document can make your text easy to read, while a poorly formatted document can make even the best writing difficult or confusing to read. The Home tab groups Word's formatting tools into three categories:

Font:

Defines the font, font size, color, highlighting, and style (bold, italic, underline, strike through, superscript, subscript, and case, Change Text Color, Highlight Text,).

Styles:

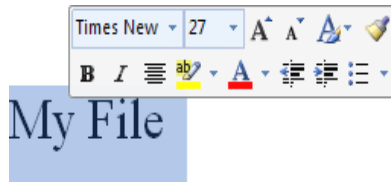

Displays predefined formatting that you can apply to your text. To format any text, you must follow these steps:

- Select the text you want to format.

- **Choose a formatting tool.**

When you choose most formatting commands, that command stays on until you turn it off by choosing the same command again.

Select text, Word displays the most commonly used formatting tools in a floating toolbar, as shown in Figure below. You can click any icon on this floating toolbar rather than click the same icon stored at the top of the screen.

Copy Formatting

If you have already formatted text the way you want it and would like another portion of the document to have the same formatting, you can copy the formatting.

To copy the formatting, do the following:

- Select the text with the formatting you want to copy.
- Copy the format of the text selected by clicking the Format Painter button on the Clipboard Group of the Home Tab
- Apply the copied format by selecting the text and clicking on it.

Hyperlink:- Link one file to another file .

Make a Hyperlink

- Select the text you wish to by a hyperlink.
- Click the Insert tab.
- Click on **Hyperlink** and select particular file then click on **OK**.

Formatting operations:-

- 1) **Font:** The Font Dialog Box lets you to do operations for formatting characters. You can also change the spacing between letters here.
- 2) **Paragraph:** The paragraph dialog box lets you to do various operations, formatting. The paragraph, like alignments, indentation and spacing.
- 3) **Bullets and Numbering :** The Bullets and Numbering dialog box allow you to various styles to give bullets and numbering
- 4) **Border and Shading:** The borders and shadings dialog box allows you create border around blocks of text or around the entire document place border and background shading to all or part of your document.
- 5) **Columns:** It allows you to apply and control columns.
- 6) **Drop Cap:** Make the first letter of paragraph or chapter large enough to set lines.

- 7) **Change Case:** It let's give to change the case of highlighted text.
- 8) **Style:** If you preferred not to use the formatting toolbar, document style can be change here.
- 9) **Background:** Another task which can be handled in the formatting toolbar. You choose the color to highlight selected text in your document.

- **Headers and footers**

Headers and footers are printed at the top and bottom of every page in the document, and may differ from section to section within the document. They can contain fields that are automatically updated as well as fixed text.

To insert a header or footer:

- Select the **Insert** tab.
- Click either the **Header** or **Footer** command. A menu appears with a list of **built-in options** you can use.
- Select one of the built-in options, and it will appear in the document.
- Type information into the header or footer.

To remove a header or footer:

- Select the **Insert** tab.
- Click either the **Header** or **Footer** command
- Click on Remove Header or Footer.

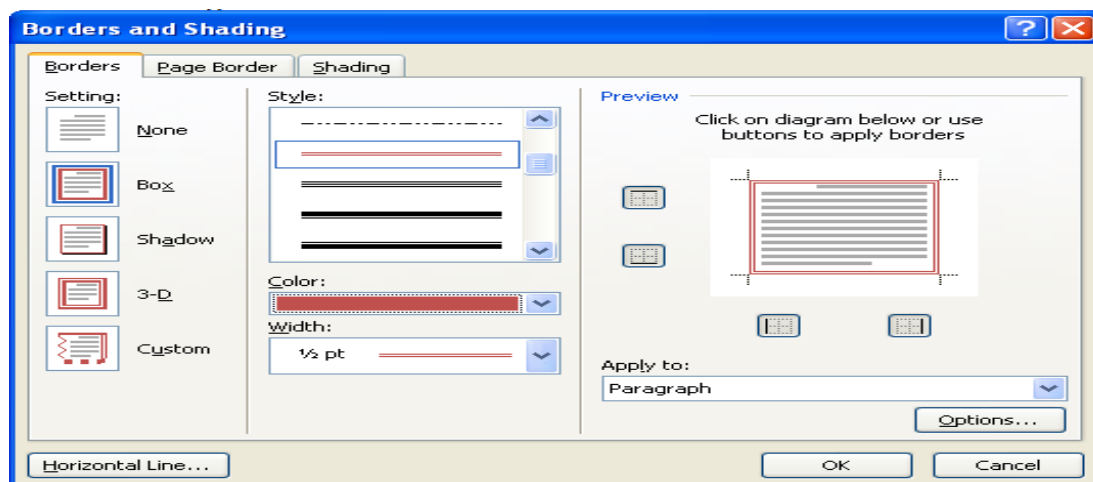

To insert Page Number:

Page number option can be used to insert page number into document.

- Select the **Insert** tab.
- Click on Page Number command. A menu appears with a list you can use.
- Select one of the options, and it will appear in the document.

- **Borders and shading :**

Using the **Design** tab, you can select a border setting, style, colour and width. The **Apply To** field lets you specify whether this should be applied to the whole paragraph or to selected text. Click **OK** to see the effect. (And then **Undo** if you don't like it!)

Using the **Shading** tab, you can select a background colour and/or pattern. **Apply To** field lets you specify whether this should be applied to the whole paragraph or to selected text. Click **OK** to see the effect.

• **Making Lists**

Word can organize and arrange text in three types of lists:

- Bullets (like this list)
- Numbering
- Multilevel list

You can create a list from scratch or convert existing text into a list. To create a list from scratch, follow these steps:

1. Click the **Home** tab and then move the cursor where you want to create a list.
2. Click the Bullets, Numbering, or Multilevel List icon. Word creates your list (bulleted or numbered).
3. Type your text and press Enter to create another blank item in your list.
4. Repeat Step 3 for each additional bullet or numbered item you want to make.

• **Ruler**

The Ruler is located below the Ribbon around the edge of the document. It is used to change the format of the document, i.e. it helps you align the text, tables, graphics and other elements of your document. It uses inches or centimeters as the measurements unit and gives you an idea about the size of the document.

- **Track Changes.** When Track Changes is on, the section is highlighted. Deletions are marked with a strikethrough, and additions are marked with

an underline. Different authors' changes are indicated with different colors.

- When Track Changes is off, the section is not highlighted. Word stops marking changes, but the colored underlines and strikethroughs are still in the document.
- **Security:** You can control access to a document by implementing a password for it. Passwords are case-sensitive and can be a maximum of 15 characters long. Create a strong password, ideally one that you can easily remember. But in case you might forget, you should also keep a copy of it in a safe place.

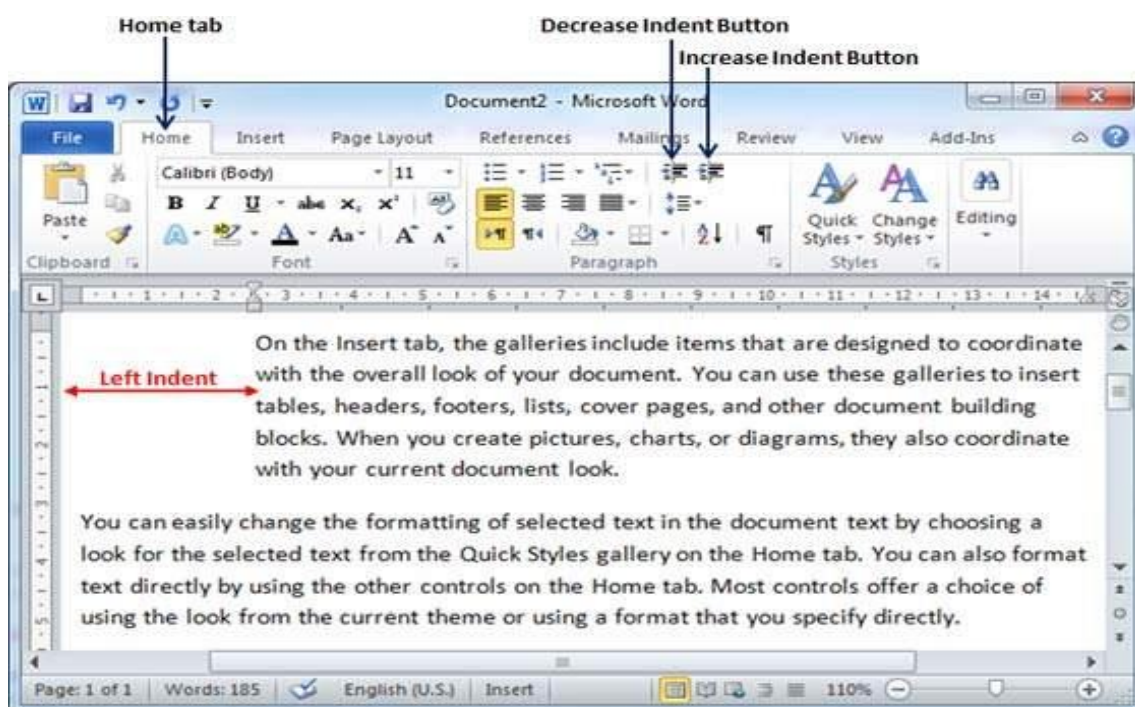

If you lose or forget your document password, Word won't be able to recover it for you.

Paper tray: paper tray is Removable cassette; where blank paper is stored for copying. It is use for printer to stored papers.

Indents: As you know the margin settings determine the blank space that appears on each side of a paragraph. You can indent paragraphs in your document from the left margin, the right margin, or both the margins.

Left Indentation: Left indentation means to move the left edge of the paragraph inward towards the center of the paragraph. Let us use the following steps to create left indentation.

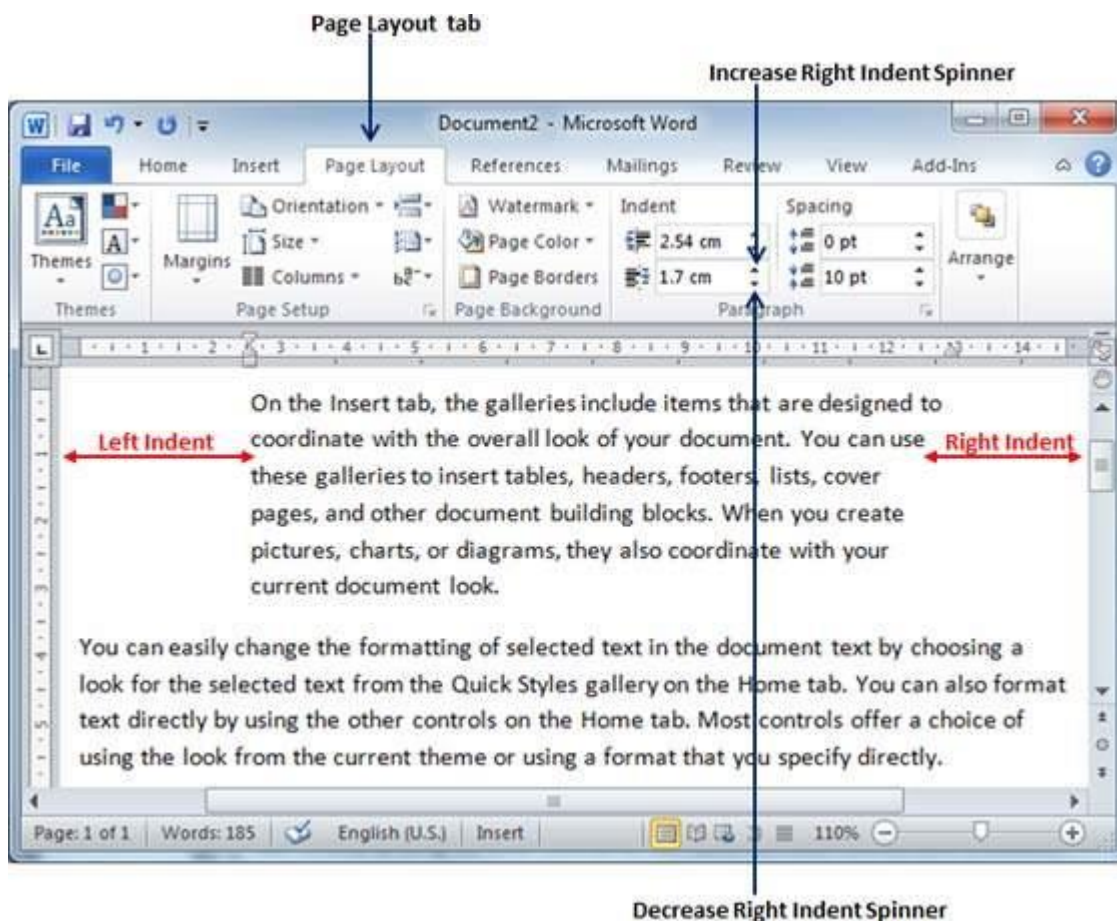

Step 1 – Click anywhere on the paragraph you want to indent left and click the Increase Indent button available on the Home tab or simply press the Ctrl + M keys. You can click multiple times to create deeper indentation.

Step 2 – You can remove left indentation by clicking the **Decrease Indent** button available on **Home** tab or simply press **Ctrl + Shift+ M** keys. You can click multiple times to remove deeper indentation.

Right Indentation: Right indentation means to move the right edge of the paragraph inward towards the center of the paragraph. Let us use the following steps to create right indentation.

Step 1 – Click anywhere on the paragraph you want to indent and then click on the Increase Right Indent spinner available on the Page Layout tab. You can click on the spinner multiple times to create deeper indentation. You can use the Left Indent spinners as well to set left indentation from the same place.

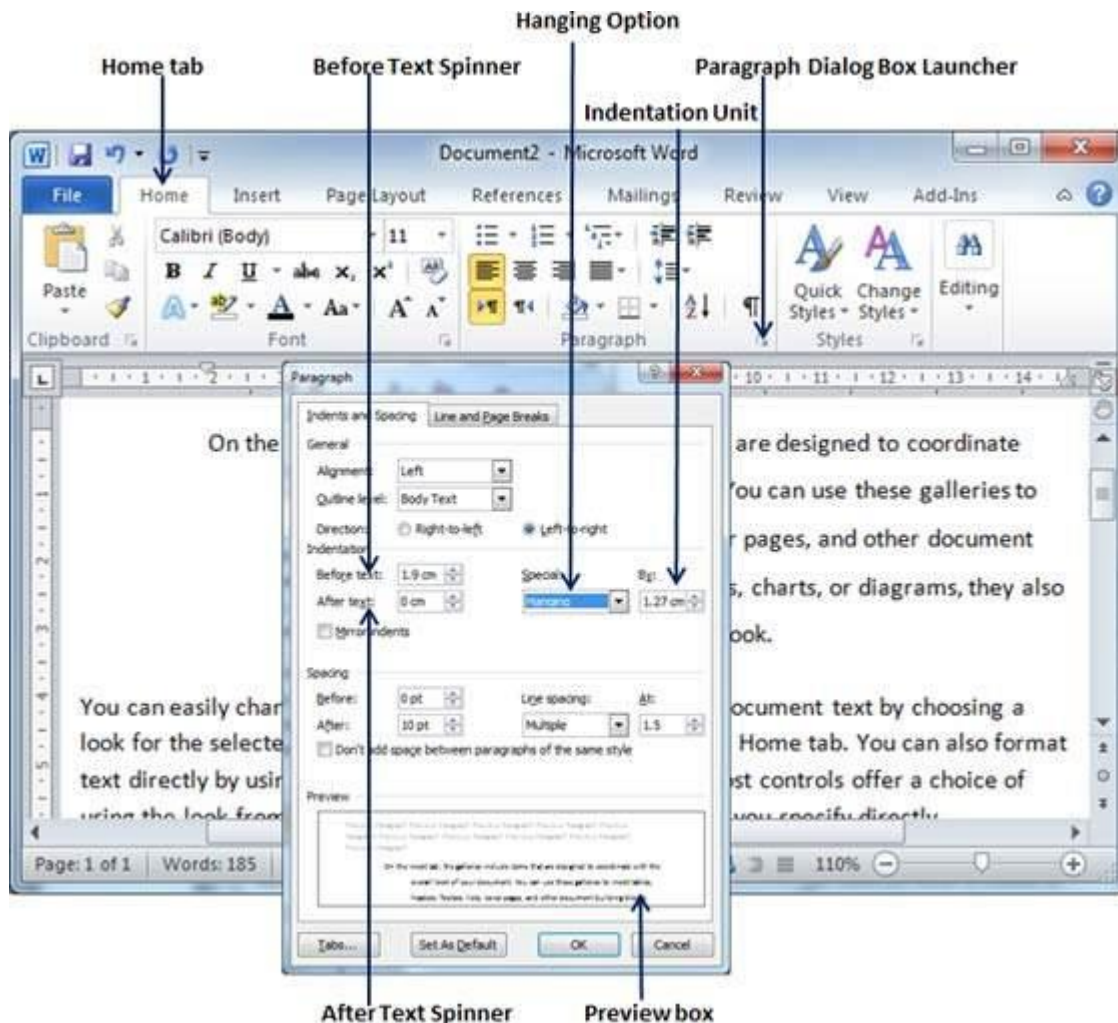

Step 2 – you can remove right indentation by clicking the **Decrease Right Indent** spinner in the opposite direction.

Hanging Indentation

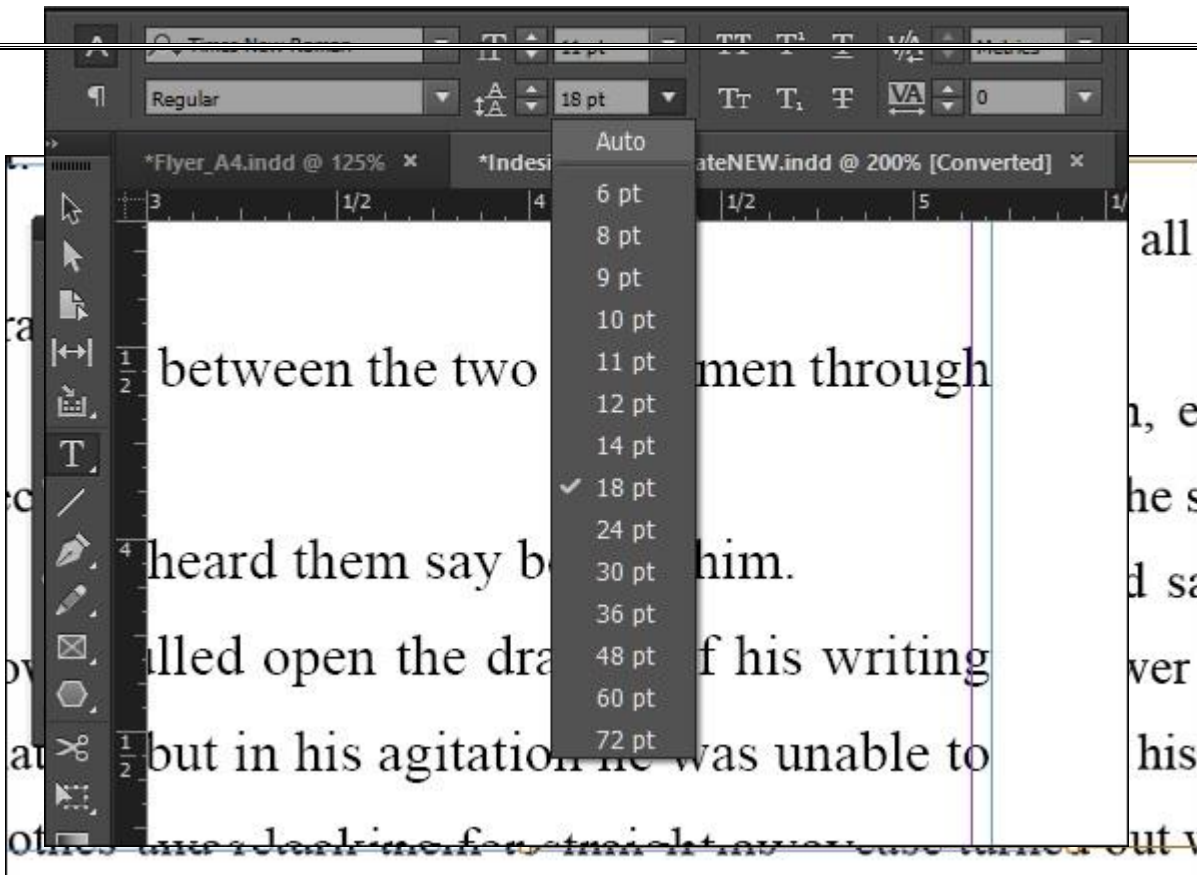

You can move the left side of the first line of a paragraph leftward, away from the center which is called the **hanging indentation**. Let us see the procedure to perform hanging indentation.

Step 1 – Click anywhere on the paragraph you want to indent right and click the **Paragraph Dialog Box** launcher available on the **Home** tab.

Step 2 – Click the **Before Text** spinner to set left indentation and select **Hanging Option** to move the left side of the first line of a paragraph leftward, away from the center. You can control the movement by setting the **Indentation Unit**.

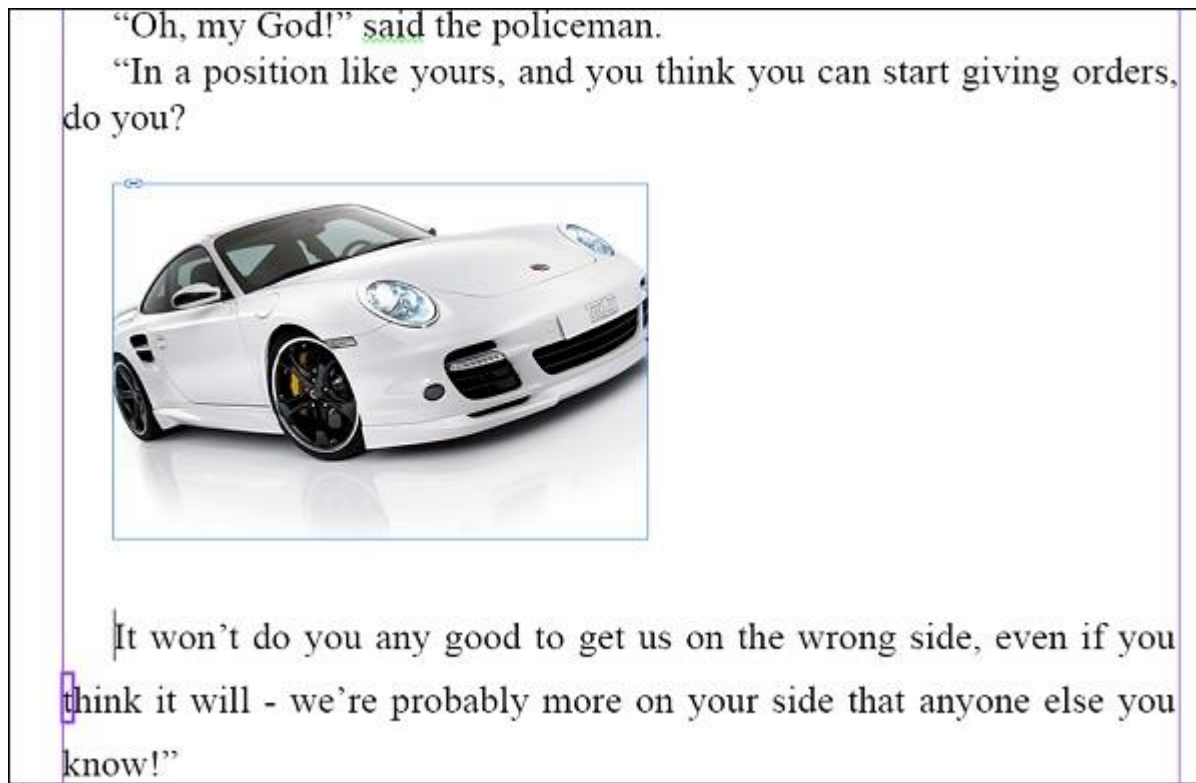

Text Wrapping: Text wrapping options can be set using the **Text Wrap panel** from the *Window* menu. Let us take an example of text wrapping around an object. When you insert an image over text, the text normally wraps itself around the frame of the image but not the image itself. The *Text Wrap* panel allows you to define the image around which the text should wrap itself. Place the image in the document and open the *Text Wrap* panel. With the image frame selected, select the third option to wrap the text around the object. It is better if the imported image has some transparency.

Anchoring Objects

Anchored objects tell In Design to keep the positioning of the object, while moving the other objects around it. To do this, first we must anchor the object. **easiest way to anchor or make an object in-line is to select the object and cut it into the clipboard.** Then use the Text tool to place the cursor in the original position of the cut object and paste the object from the clipboard back again.

You will see the object being properly inserted. If you change the text above or below the object, the object also flows along with the text as it is now anchored or in-line with the text.

___In this page, even if we choose to edit or delete the text above the car, the car will follow the edit instead of jumping above or below the text

Insert Page Breaks :

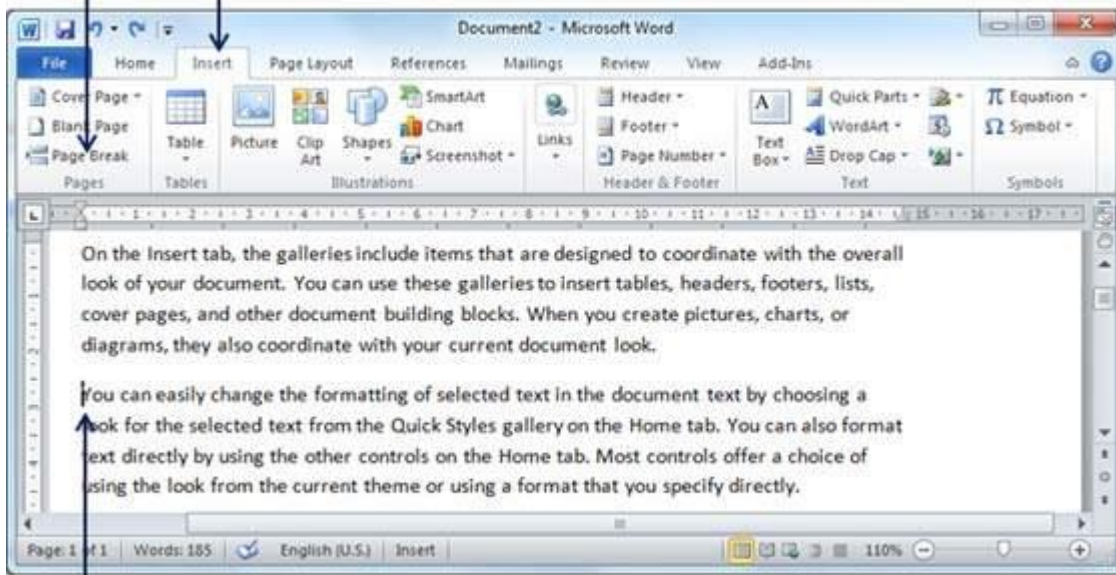

Step 1 – Bring your insertion point immediately before the text that has to appear on a new page.

Step 2 – Click the **Insert tab**, and click the **Page Break** button available in the Pages group.

Word inserts a page break and moves all text after the page break onto a new page. You can also use the **Ctrl + Enter** keys to create a page break at the pointed location.

Page Break Button

Insert tab

Insertion Point

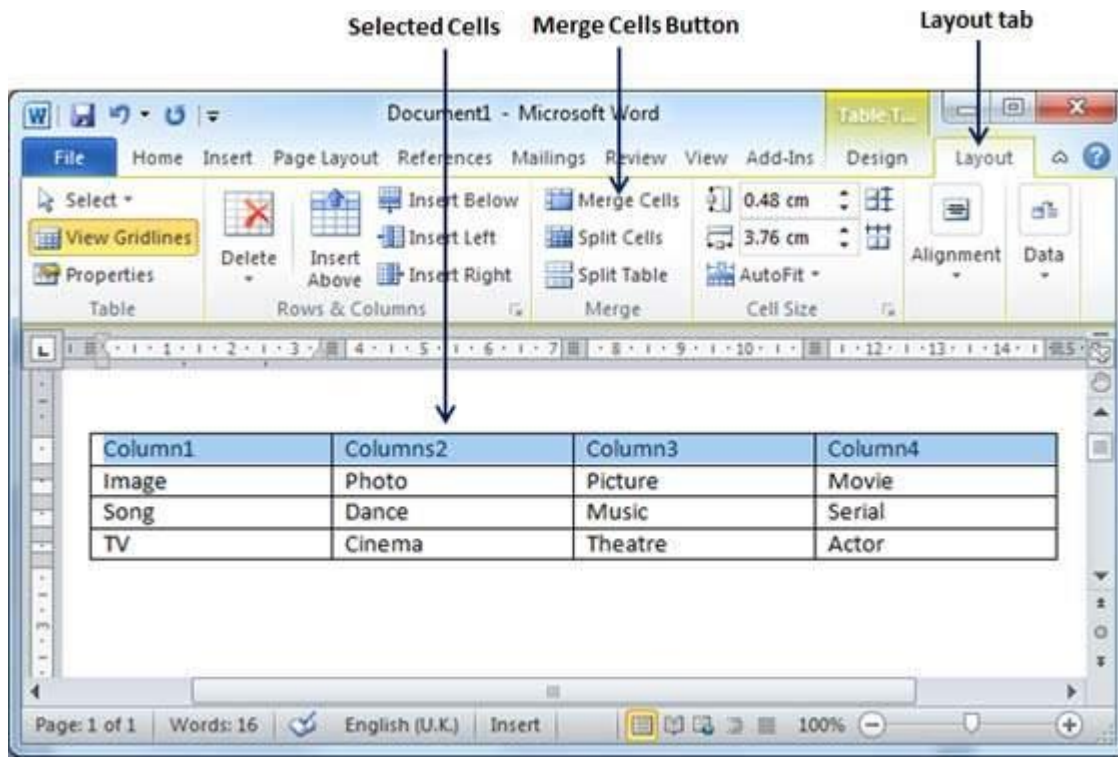

Delete a Page Break

Just put the insertion point on the previous page of the page break that needs to be deleted. Press the **Delete** key multiple times until both the pages get merged.

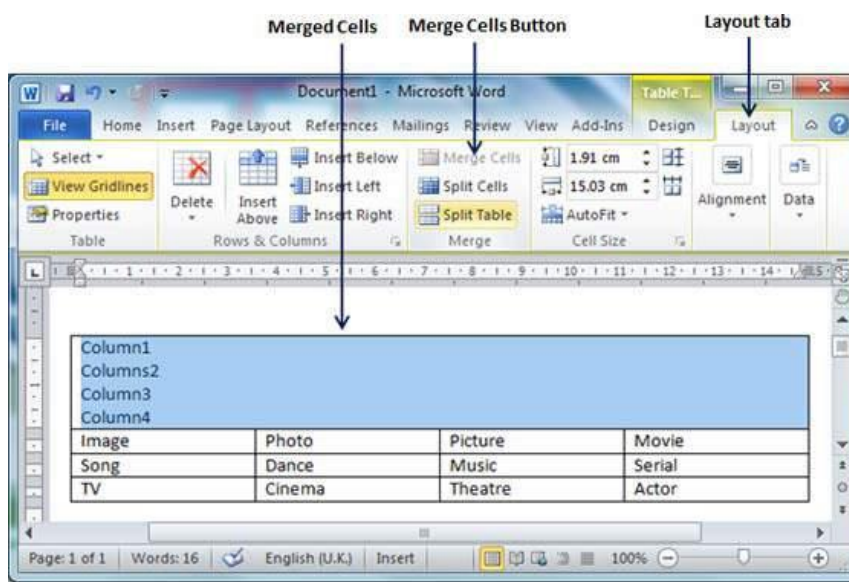

Merging Cells: Merging of two or more cells to create one large cell. You will frequently need to merge columns of the top row to create the title of the table. You can merge cells either row-wise or column-wise, rather you cannot merge cells diagonally.

The following steps will help you merge table cells in a Word document.

Step 1 – Bring your mouse pointer position inside the first cell that you want to merge. Now press the **Shift** key and click the cells around the cell which you want to merge into the first cell. This will highlight the cells which you click and they will be ready to be merged.

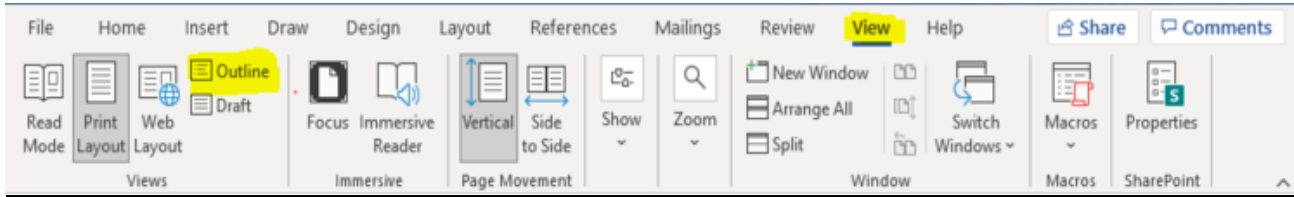

Step 2 – Now click the **Layout tab** and then click the **Merge Cells** button which will merge all the selected cells.

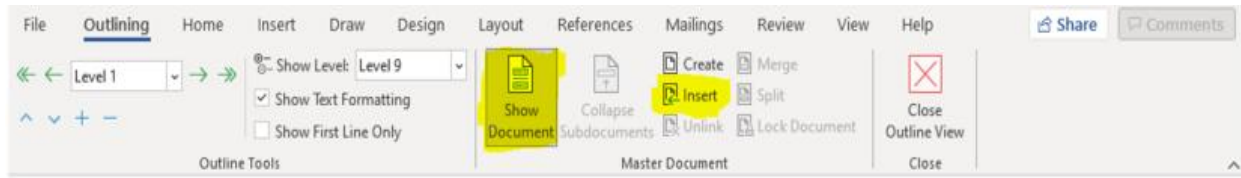

Create a Master Document Using Existing Files

1. Create new, blank document and save it as "Master"
2. Click View > Outline

3. Click Show Document and then "Insert"

4. On the Insert Subdocument dialog box, navigate to the location of the documents you want to insert. Select the first file and click Open.
5. If the following dialog box displays, telling you about a style that exists in both the subdocument and the master document, click the Yes to All button. This keeps all the styles in the subdocument consistent with the styles in the master document.
6. Repeat steps for the other documents.
7. Save document
8. Click on Collapse Subdocuments to close out of Outline View.

Mail Merge :-

Mail Merge is a powerful tool for writing and sending a personalized letter or e-mail to many different people at the same time.

Mail Merge is one of the feature of MS-Word. Sometimes there is a situation when you want to send the same type of letter or document to may person who reside at different location. The letters contain the address of each receiver in addition to the standard information contained in it. One way of doing this is to prints the letter by changing the address each time in the document after printing such letter. But this would mean lot of effort and time .Such problems are taken care of by the Mail merge facility.

In word processing this facility is used when same matter is to be forwarded to many persons at a time. In this case one file is used which contain the matter that has to be same in all letters without names and addresses. And other file is created which contains the only names and addresses of the person who will receive letter.

Using Mail merge facility word processor software gets name and addresses from this file and one separate letter is printed to reach name and addresses. Both the files were merged by the word processor program automatically. So, Mail Merge facility of MS-Word let you to send the same letter to a number of persons without typing the content of the letter again and again.

Steps to create Mail Merge:-

- 1) To start a mail merge, open Microsoft Word 2007, and click on the **Mailings** tab.
- 2) Find the **Start Mail Merge** button under the Mailings tab and click the arrow beside it. Choose the last option, **Step by Step Mail Merge Wizard**.
- 3) Select **Letters** then click on the **Next: Starting document** link at the bottom of the task pane to go to the next step to select your starting document.
- 4) Select **use the current document**.
- 5) Then Click on **Next: select recipients**
- 6) At this point you have options to use **an existing list, select from outlook contacts, Type new list**. Select **Type new list** (If contact list does not exist) and then click on **create**.
- 7) In **New Address List** insert Record .For Inserting Next Record Click On **NEW ENTRY** (e.g. First Name, Last Name, Address etc.)and then Click on **OK**.
- 8) **Save** Address List and then Click **OK**
- 9) Click on **Insert Field Merge** and insert field.
- 10) Click on **Finish & Merge** and select **Edit Individual Documents** then select **All** and click on **OK**

• **Table** :-

Insert a table:-

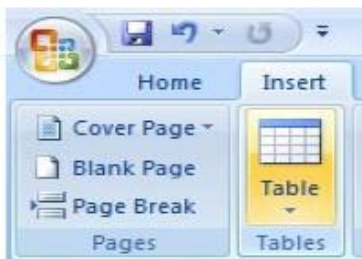

A table is made up of rows and columns. The intersection of a row and column is called a cell. Tables are often used to organize and present information, but they have a variety of uses as well. You can use tables to align numbers and create interesting page layouts.

Using Tables

- You can insert a table into your document. Each cell within the table can display text or a graphic. Each cell or the entire table can be formatted as required.

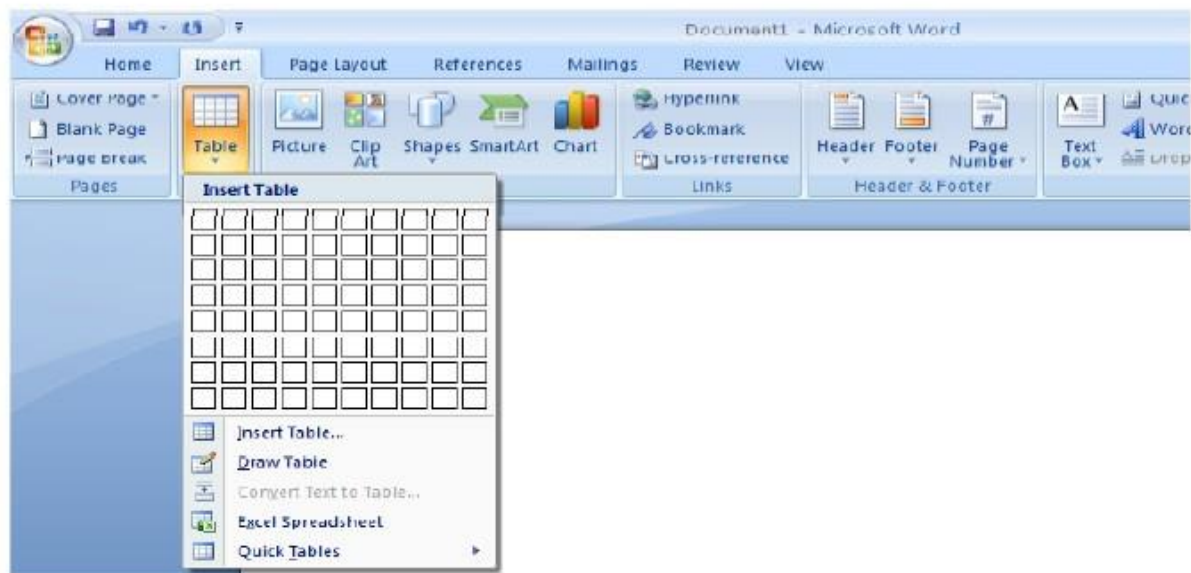

Inserting a table

- Open a document called **Tables**. Read the instructions within this document. We are going to insert a table containing 4 columns and 3 rows.
- Display the **Insert** tab and you will see the **Tables** group displayed as illustrated.

- Clicking on the table will display the following.

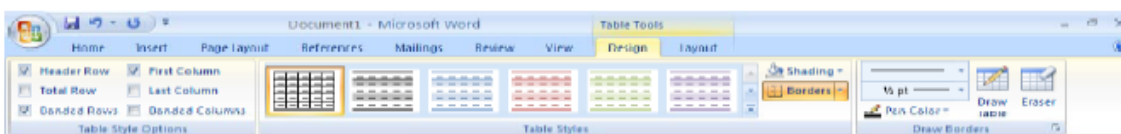

- Clicking on the table will display the following.

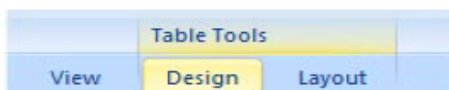

- If you move the mouse pointer over the cells displayed in the drop down you will see that a preview version of the table is displayed within your document.

- Click when you see a **4x3 Table** displayed (in the area immediately above the cell drop down). The table will be inserted into the document, as illustrated.

- Notice that the display at the top of your screen has changed. As you are within the table you have just selected, Microsoft Word automatically displays commands and options related to modifying and formatting your table.

- Click outside your table and the table will display its original commands. Re-clicking within the table will again display Table related commands. If you do not see the table commands displayed you will notice that there is a **Table Tools** option displayed at the top of your page (above the normal tabs). Click on this to display your table related commands.

Navigating within a table

- Click within the first cell in the table. Type in the name of the town or city in which you live.
- To move to the next cell press the **Tab** key (or click within the cell using the mouse pointer). Type in the name of another town or city. Carry on in a similar fashion until all the cells contain the name of a town or city.
- Try pressing **Shift+Tab**. As you will see this moves you to the previous cell.

Selecting and editing text within a table

- Click within the first cell. Double click on the word within this cell and change the word to your first name. Navigate to the second cell and overwrite the contents with your second name. You can edit the text within a cell rather than replace the entire text by selecting the part of the text you wish to edit and then typing in your changes.

Selecting cells, rows, columns or the entire table

- It is important to know how to select elements within your table. Practice these selection techniques using the table you have created.

To Create a Table:

- 1) Click the **Insert** tab on the Ribbon
- 2) Click the **Table** button
- 3) Select **Insert Table**
- 4) Click the arrows to select the desired number of columns
- 5) Click the arrows to select the desired number of rows
- 6) Click **OK**

To Insert a Row:

- 1) Position the cursor in the table where you would like to insert a row
- 2) Select the **Layout** tab on the Ribbon
- 3) Click either the **Insert Row Above** or the **Insert Row Below** button in the **Rows & Columns** group

To Insert a Column

- 1) Position the cursor in the table where you would like to insert a column
- 2) Select the **Layout** tab on the Ribbon
- 3) Click either the **Insert Columns to Left** button or the **Insert Columns to Right** button in the **Rows & Columns** group

To Merge Cells in a Table

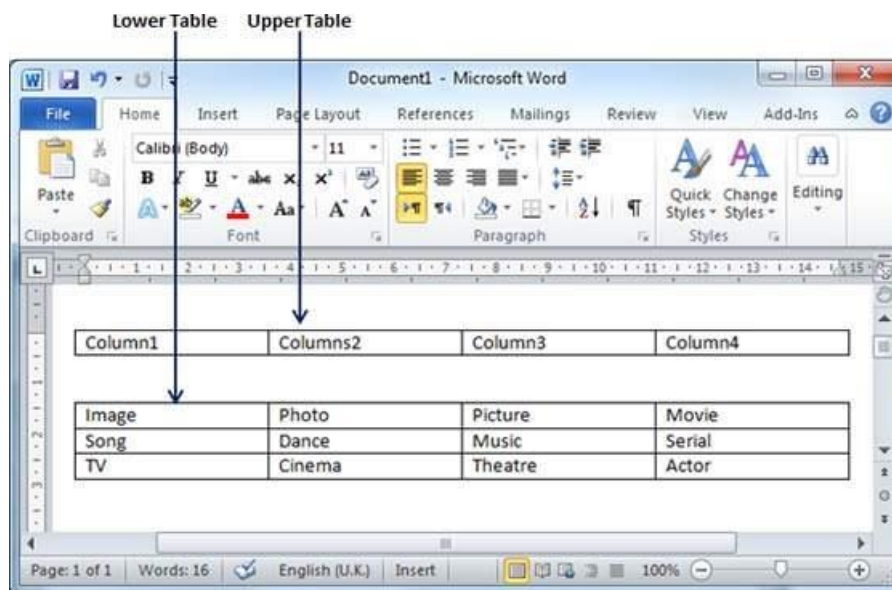

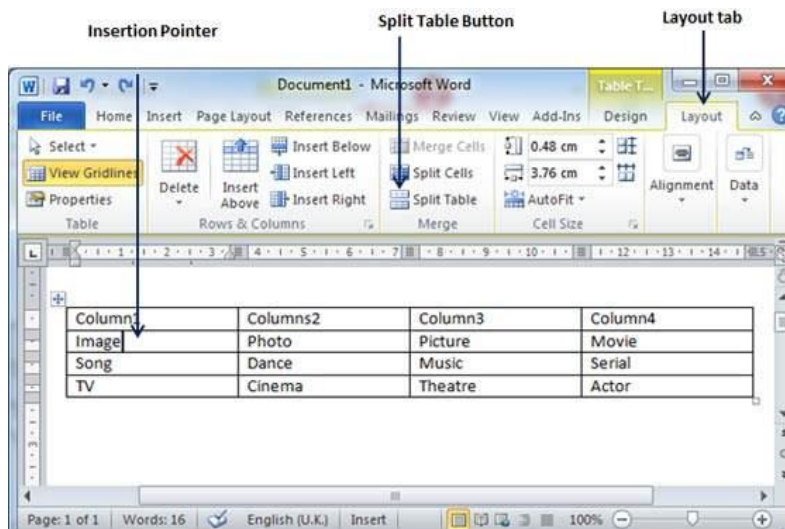

- 1) Select the cells that you would like to merge in the table
- 2) Click on the **Layout** tab on the ribbon

- 3) Click the **Merge Cells** button in the Merge group

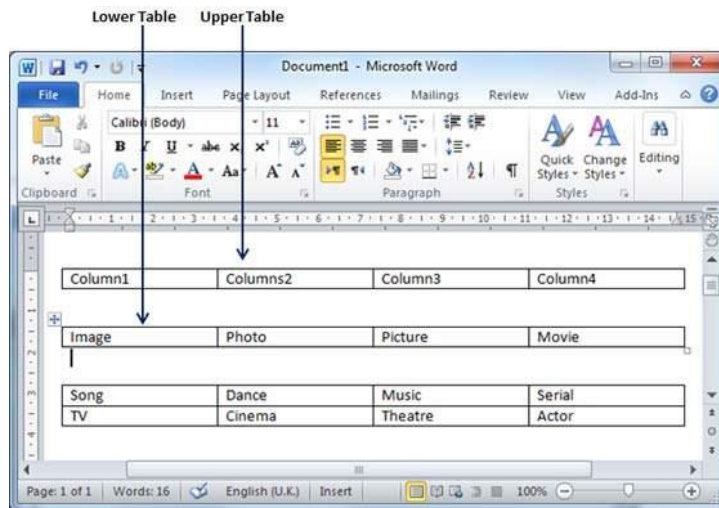

Split a table:- Microsoft Word allows splitting a table into multiple tables but a single operation will always divide a table into two tables.

Step 1 – Bring your mouse pointer position anywhere in the row that should appear as the first row of the new table.

Step 2 – Now click the Layout tab and then click the Split Table button which will split the table into two tables and the selected row will become the first row of the lower table.

After splitting the table into two tables, you can further divide it into two parts and you can continue dividing the Word tables as long as a table has more than one row.

Graphics:-

You can insert special **characters, symbols, pictures, illustrations, and Watermarks** in word.

A **picture** is a two-dimensional image .

An **object** can be created within your document, or created using another program and then included in your document.

Inserting pictures:-

After you have inserted a picture in your document, you can resize it, move it, or change the way that text flows around it.

□ To insert a picture, click at the place in the document where you want the picture to be inserted. Click **Insert – Illustrations – Picture**, browse to select the picture that is required, and double-click to place it in your document. In this way user can insert Clipart, Shapes, Smart Art, chart etc.

Using graphics within Microsoft Word

- Microsoft Word has a range of graphic formats that can be inserted into a document, including Pictures, ClipArt, Shapes, SmartArt and Charts.

Inserting Pictures

- Click on the **Insert** tab and then click on the **Pictures** icon.

This will display the **Insert Picture** dialog box.

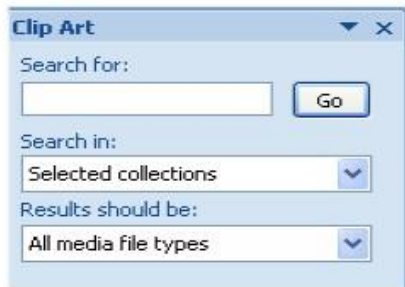

You should see a folder called '**Sample Pictures**'. Double click on this folder to view the contents and then insert one of these pictures into your document.

Inserting Clip Art

- Click on the **Insert** tab and then click on the **Clip Art** icon.

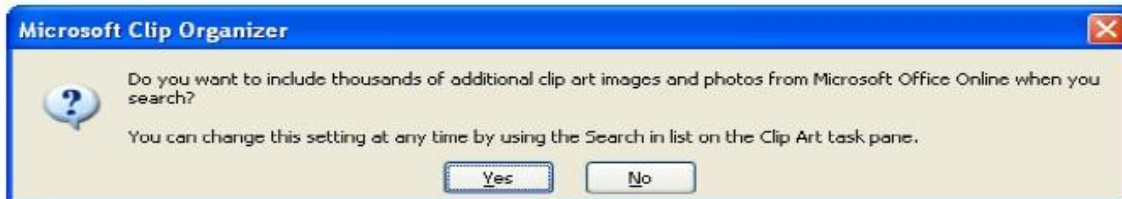

- This will display the Clip Art pane down the right hand side of the screen.

- Within the '**Search for**' section type in a keyword that describes the type of clip art you are looking for. In this case type in the word **computer**, and then click on the **Go** button.

NOTE: You may see the following message. If so click on the **Yes** button as you will be able to use more clip art images.

- After a short delay the clip art images will be displayed down the right side of your screen. You will need to use the scroll bars to review all the images that are available.

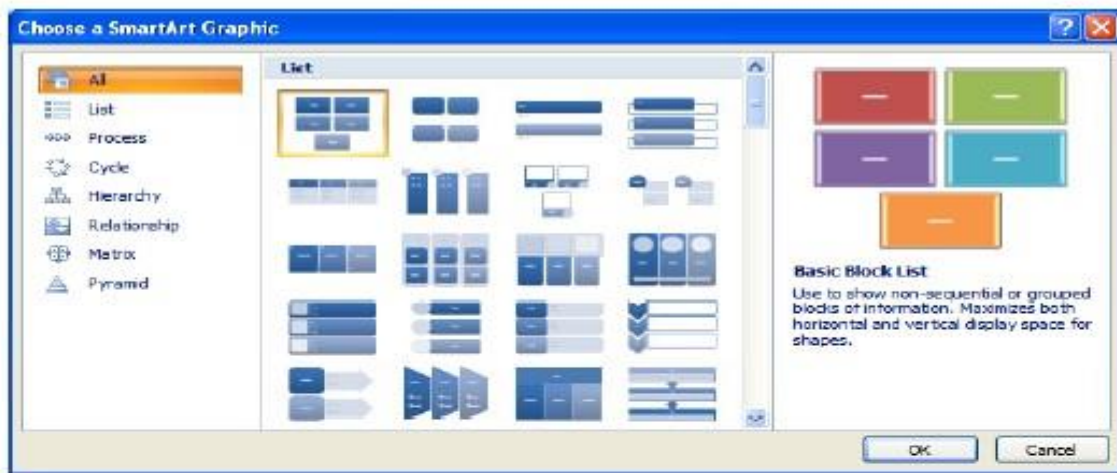

Inserting SmartArt

- Create a new document and save the document as a file called **My SmartArt**. Click on the **Insert** tab and then click on the **SmartArt** icon.

You will see the **Choose a SmartArt Graphic** dialog box displayed.

You will see the **Choose a SmartArt Graphic** dialog box displayed.

- Slowly scroll down the list to view the amazing variety of SmartArt graphic shapes that are available.
- Scroll back up the list and select the **Pyramid List** graphic.

- Click on the **OK** button

- **Using Templates**

A **template** is a predesigned document you can use to create new documents with the **same formatting**. With a template, many of the more important document design decisions such as margin size, font style and size, and spacing are predetermined.

Creating a new document from a template

The easiest time to use a template is before you have typed any text.

To create a new document from a template, follow these steps:

1. Click the Office Button and then choose New. A New Document window appears and then click one of the following in the left pane of the New Document window:
Installed Templates: Displays templates installed on your computer. Templates let you create a new document based on the formatting of an existing file.
2. Click a template and then click Create.
3. Type new text and use the Style icons to apply the predefined formatting from your template to your text.

- **Printing a document**

Now it's finally time to see your words on paper!

Previewing and Printing a Document Click the File Menu, point to print and select one of the following Options:

- **Print** allows you to select a printer, number of copies, and other printing options before printing.
- **Quick Print** allows you to send the document directly to the default printer without making changes.
- **Preview** allows you to preview and make changes to pages before printing.

To preview the document before printing:

- Click the **File Menu**.
- Select **Print → Print Preview**. The document opens in Print Preview format.
- Click **Print** to print the document or **Close Print Preview** to exit the preview format and make changes to the document.

In **Print Preview format**, you can perform many tasks, including:

- Modifying margins
- Changing page orientation
- Changing page size
- Zooming in and out to view various parts of the document
- Viewing multiple pages
- Accessing Word Options to change several Word settings

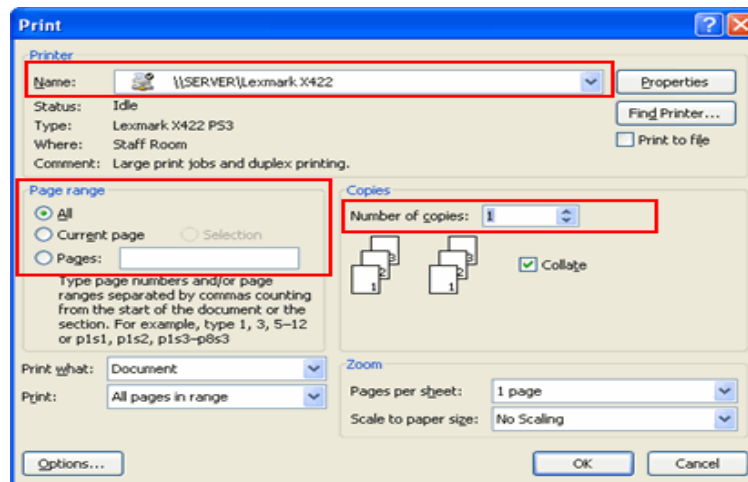

To print:

- Click the File Menu.
- Select **Print → Print**. The Print dialog box appears.
- Select the pages you want to print—either **all pages** or a **range** of pages.
- Select the **number of copies**.
- Check the **Collate** box if you are printing multiple copies of a multi- page document.
- Select a printer from the drop-down list.
- Click OK.

If you have more than one printer to choose from, they will be available in the *Printer* area. Click the drop-down arrow next to the **Name** field to select your preferred printer.

To print via Quick Print:

- Click the File Menu.
- Select **Print → Quick Print**.
- The document automatically prints to the default printer.

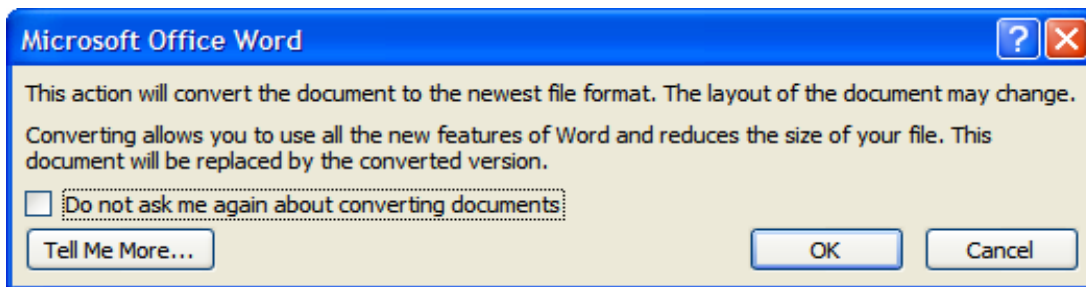

Converting a Document

To convert a document created in an earlier version of Word:

1) Click the **File Menu**, and then **click Convert**.

NOTE: *Convert will only become an option after a document created in an earlier version of Word is opened.*

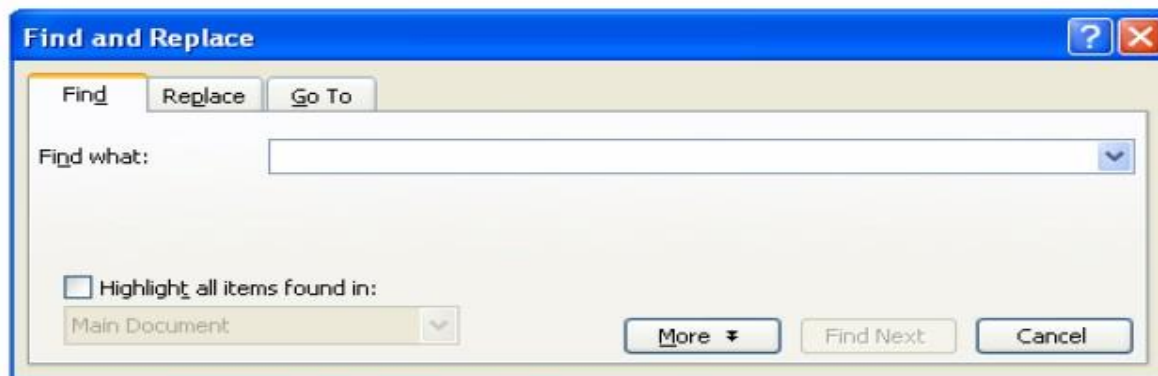

2) The following message will appear:

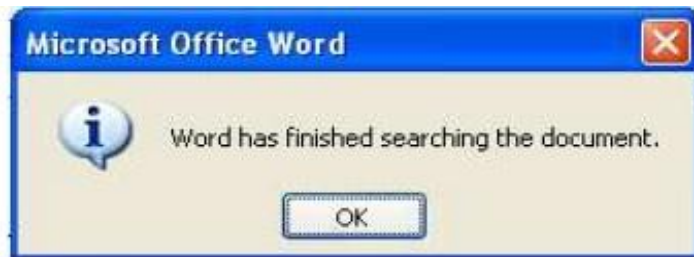

- 3) Click **OK**
- 4) Click the **File Menu**
- 5) Click **Save**

Searching text

- ❖ Open any document.
- ❖ Click **Edit** menu and then click **Find** option. You will get a screen as shown below.

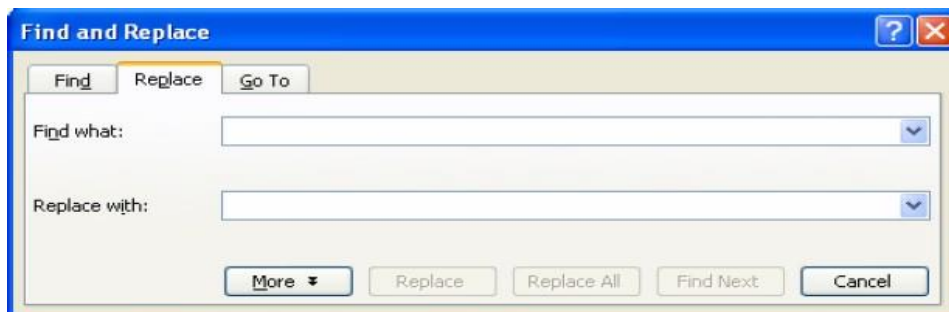

- ❖ In **Find What** text box type the word you want to find and then click **Find Next** button.
- ❖ Continue clicking **Find Next** button until you get the screen shown below.

- ❖ Click **OK** button and then click **X** to close **Find and Replace** dialog box.

Replacing text

- ❖ Open any word document.
- ❖ Click **Edit** menu and then click **Replace** option. You will get the dialog box as shown below and type the word with which you want to replace.

- ❖ Click **ReplaceAll** button once. You get the below dialog box.

- ❖ Click **OK** button and then click **X** to close **Find and Replace** dialog box.

The importance of proofing

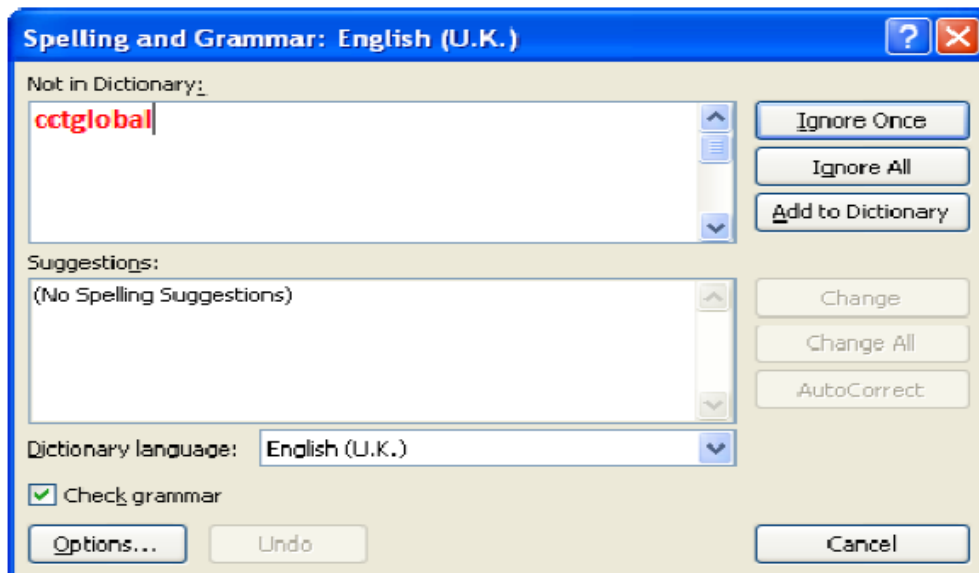

- When you have finished writing a letter always read it through before printing. Change any errors you find. Run the spell checker to find any spelling or grammatical errors. The keyboard shortcut to run the spell checking program is **F7**.
- Preview the document within the **Print Preview** view. Does the text look balanced on the page? Does everything else look correct?
- Print out the document and read through it one more time. Often when you read a printed document you see errors that you somehow missed when reading the document on the screen.

Spell checking a document

- Open a document called **Printing**.
- Press **F7** to start the spell checking program. Allow any changes that you think are necessary and then close the spell checking program.

Adding words to the built-in custom dictionary

- The spell checker works by comparing words contained within your document with a list of words contained within a dictionary. Sometimes Microsoft Word will highlight a word it does not recognize but this word may be a specialist word or a trademark word used within your particular business or organisation. You can easily add words to the dictionary. Type in the word **cctglobal**. Run the spell checker program (by pressing **F7**). You will see the **Spelling and Grammar** dialog box displayed.

- Click on the **Add to Dictionary** button. From now on when you use the spell checker, it will recognise this word.

❖ Digital signature :-

A digital signature is an electronic, encrypted, stamp of authentication on digital information such as e-mail messages, macros, or electronic documents. A signature confirms that the information originated from the signer and has not been altered.

- **Signing certificate and certificate authority :-**

Signing certificate: - To create a digital signature, you have to have a signing certificate, which proves identity. When you send a digitally-signed macro or document, you also send your certificate and public key. Certificates are issued by a certification authority, and like a driver's license, can be revoked. A certificate is usually valid for a year, after which, the signer must renew, or get a new, a signing certificate to establish identity.

Certificate authority (CA) :- A certificate authority is an entity similar to a notary public. It issues digital certificates, signs certificates to verify their validity and tracks which certificates have been revoked or have expired.

Create a signature line :-

1. In the document or worksheet, place your pointer where you want to create a signature line.
2. On the **Insert** tab, in the **Text** group, click the **Signature Line** list, and then click **Microsoft Office Signature Line**.
3. In the **Signature Setup** dialog box, type information that will appear beneath the signature line:

- **Suggested signer :-** The signer's full name.
 - **Suggested signer's title :-** The signer's title, if any.
 - **Suggested signer's e-mail address :-** The signer's e-mail address, if needed.
 - **Instructions to the signer :-** Add instructions for the signer, such as "Before signing the document, verify that the content is correct."
4. Select one or both of the following check boxes:
 - **Allow the signer to add comments in the Sign dialog box:** - Allow the signer to type a purpose for signing.
 - **Show sign date in signature line:** - The date the document was signed will appear with the signature.

Sign the signature line in Word

When you sign a signature line, you add a visible representation of your signature and a digital signature.

In the file, right-click the signature line.

1. From the menu, select **Sign**.
 - To add a printed version of your signature, type your name in the box next to the **X**.
 - To select an image of your written signature, click **Select Image**. In the **Select Signature Image** dialog box, find the location of your signature image file, select the file that you want, and then click **Select**.
 - To add a handwritten signature (Tablet PC users only), sign your name in the box next to the **X** by using the inking feature.
 - Click **Sign**.
 - The **Signatures** button appears at the bottom of the document or worksheet.
 - The following image shows the **Signatures** button.

X

First Name Last Name
Title

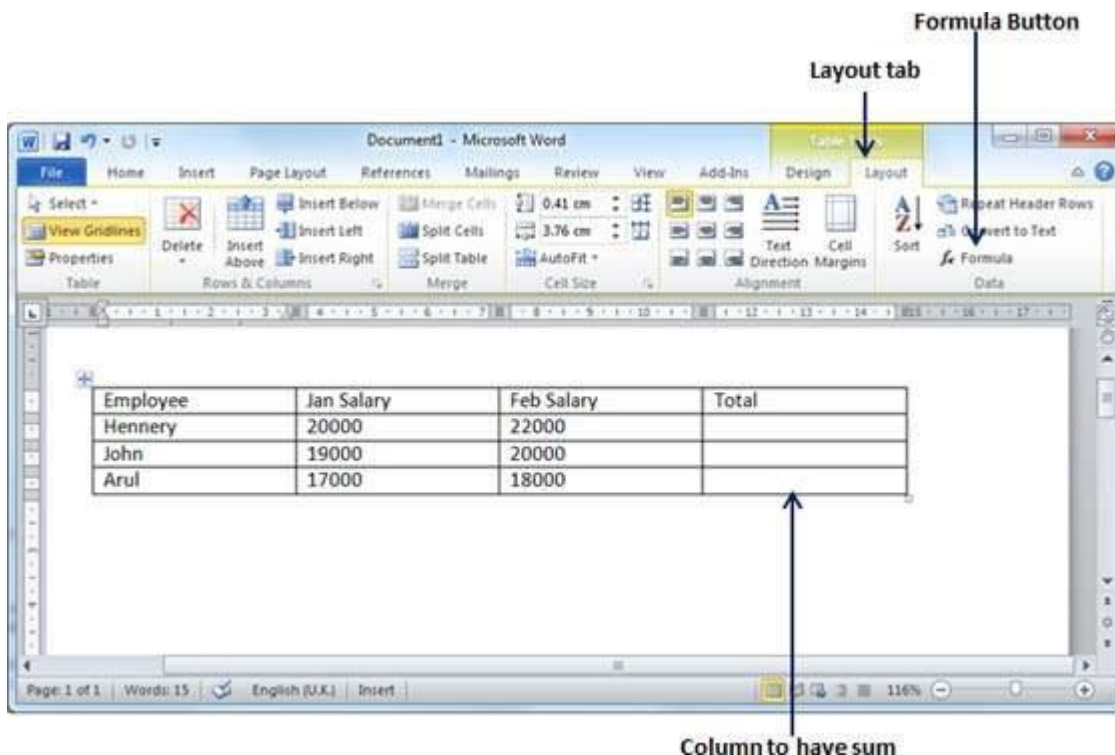

Remove digital signatures Open the document or worksheet that contains the visible signature you want to remove.

1. Right-click the signature line.
2. Click **Remove Signature**.
3. Click **Yes**.

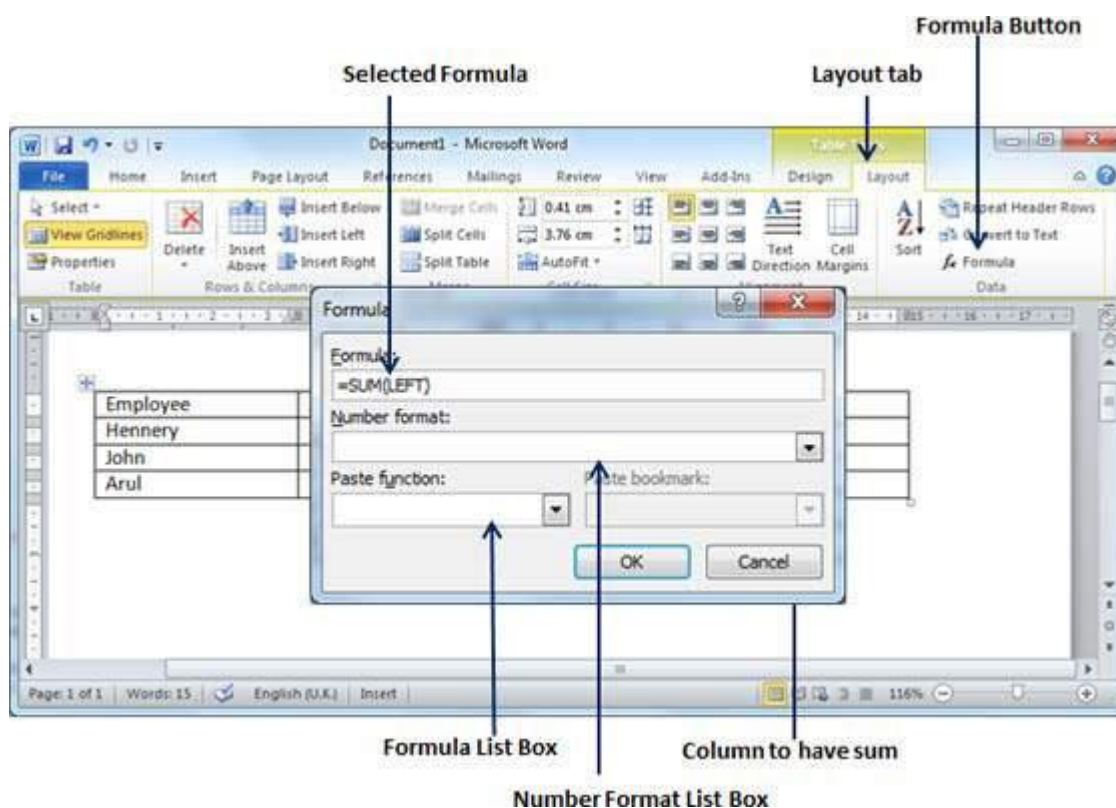

Add a Formula: Microsoft Word allows you to use mathematical formula in table cells which can be used to add numbers, to find the average of numbers, or find the largest or the smallest number in table cells you specify.

Following are the simple steps to add formula in a table cell available in Word document.

Step 1 – Consider the following table with the total number of rows. Click in a cell that should contain the sum of the rows.

Step 2 – Now click the **Layout** tab and then click the **Formula** button; this will display a **Formula Dialog Box** which will suggest a default formula, which is **=SUM(LEFT)** in our case. You can select a number format using **Number Format List Box** to display the result or you can change the formula using the **Formula List Box**. **Step 3** – Now click **OK** to apply the formula and you will see that the left cells have been added and the sum has been put in the total cell where we wanted to have it. You can repeat the procedure to have the sum of other two rows as well.

• **Creating or Changing Wizards**

Many people use the handy Wizards that are included with Word. Some of these Wizards are used to create specialized documents. MSWord includes Wizards to help create different types of legal documents and business letters. These templates help you to quickly create generalized versions of documents. You can create your own Wizards. To create a Wizard, **follow these general steps:**

1. Create a document template that defines the most general appearance of the document.
2. Create the macros necessary for the Wizard. These macros create the user interface and modify the document under program control.
3. Make sure the macro is set to automatically run when the document template is opened.
4. Rename the template (DOT) to a Wizard file (WIZ).

To modify an existing Wizard, follow these steps:

1. Use Word to open the WIZ file. Make sure you use the Open option from the File menu; don't double-click on the WIZ file, as this will start the Wizard.
2. Immediately save the Wizard file under a different name. Make sure you use the WIZ extension for the file.
3. Choose Macro from the Tools menu, then choose Macros from the resulting submenu. Word displays the Macros dialog box.
4. Make sure that only the macros in the current file (your Wizard) are displayed.
5. Modify the macros included in the Wizard to do what you want them to do.
6. Modify the Wizard document itself.
7. Save your changes.
