

ASSIGNMENT-1

1. Write a program to implement all types of inheritance.
2. Write a program that shows use of pointer to base class and derived class
3. Write a program that shows use of virtual function and pure virtual function.
4. Write a program that shows use of abstract class
5. Write a program that shows use of virtual destructor
6. Write a program to print exam result: for that design three classes student, exam and result. The student class has data members such as roll number, name, standard etc. Create the class exam by inheriting the student class. The exam class has data members such as marks of six subjects. Derive the result class from exam class and it has own data member totol_mark and percentage.
7. Consider the example to print pay slip of an employee. Design four classes employee, earning, deduction and payslip. The employee class has data member's emp_no, emp_name, address, contactNo etc. The earning class has data members basic_pay, da, ta, hra etc. The deduction class has data members loan_interest, fund_amount, lic_amout etc. Derive the payslip class from classes employee, earning and deduction to print the pay slip of an employee.
8. Create class Book (base) with data member's bookID, title, author etc. The LibraryBook (derived from Book) has data members isIssued, issueDate etc. The LibraryReport (derived from LibraryBook) with Track total issued books and display all book details with status.
9. Create a base class BankAccount with account_number ,balance and account hoder name. Derive SavingsAccount (with interest_rate and minimum_balance) and

LoanAccount (with interest_rate and loan_amount loan_amount, loan_term). Calculate interest for both accounts and display it.

10. Write a program that shows behavior of constructor and destructor in inheritance.

11. Write a program to implement container class.

12. Write a program to implement member function overloading in c++.
